PROPERTIES OF PARAFFIN AND PARAFFIN BLENDS WITH REFERENCE TO THE COATING PROCEDURE. Communication no. 2 on Properties of Paraffin Melts for the Surface Coating of Papers. [1960] 18p. 15 refs
Order from SLA mi$2.40, ph$3.30 61-10269

Trans. of Fette Seifen Anstrichmittel (West Germany) 1960 [v. 62] no. 3, p. 175-182.

The investigations were carried out on highly refined paraffin (60/62°C) with additions of microparaffin Mikro 78, polyisobutylene Oppanol B 15, and a polyethylene type of the molecular weight 8000. The addition of microparaffin in small percentages causes a definite increase in viscosity just above the melting point. A sudden increase in viscosity is noticeable when more than 2% Oppanol B 15 is added. A comparison with the usual methods for the determination

of melting and softening points shows that only a thermic analysis is capable of precisely representing the actual phase transformation. Between the solidification and transformation points, the paraffin is a rather soft mass. The actual formation of hardness coincides approximately with the transformation point, which for highly refined Indonesian slab paraffin 60/62 lies between 47° and 46°C. Paraffin can take up a considerable percentage of microparaffin without changing significantly its behavior as regards hardness; a significant softening was achieved only at above 20% additives. Addition of polyethylene (MG = 8000) used in the experiments increased the flowing point hardness in the softening range. Comparative measurements of the blocking behavior of coated papers showed a good agreement between the thermically determined transformation temperatures, between the softening and blocking temperature of paraffins and blends with microparaffin, polyethylene, and polyisobutylene as determined by the conical flow point method.
